

Flavouro Project - Full Code Explanation

AI Mock Interview Script with Sample Answers

Section 1: AI Mock Interview Script with Answers

Introduction

Q: Tell me about yourself.

A: Im Shivam Sharma, currently pursuing MCA at University of Delhi. I have frontend experience from my internship at CDAC, where I built responsive educational tools. I also created Flavouro, a food ordering app built with React, Redux Toolkit, and Tailwind CSS, showcasing my skills in state management and UI development.

Project-Based Questions

Q1: Explain the architecture of your Flavouro project.

A: Flavouro is component-based. Each feature (Navbar, Cart, FoodCard) is isolated. State is managed centrally with Redux Toolkit. Routing is handled with react-router-dom. ProtectedRoute ensures secure navigation, and Tailwind is used for responsive design.

Q2: Why Redux Toolkit over useState or Context?

A: Redux Toolkit is scalable and reduces boilerplate. It allows consistent global state for cart, filters, and search with less effort than raw Redux or Context API.

Q3: How does your cart system work?

A: The cart is managed via Redux slices. Actions like addItem, removeItem, and increaseQty are dispatched to update cart state. Item quantity and total amount are computed and displayed in Cart.jsx.

Q4: How is success page protected?

A: A custom ProtectedRoute checks if cart items exist using a Redux selector. If the cart is empty, it redirects the user back to the home page.

Q5: What would you do differently?

A: Id integrate backend for real orders, user login, persistent state with localStorage, and maybe Stripe for payments.

Technical Questions

Q1: Controlled vs Uncontrolled Components?

A: Controlled components use state to manage form values. Uncontrolled components use refs. Controlled is better for validation.

Q2: Tailwind vs Bootstrap?

A: Tailwind is utility-first, allowing custom design with low CSS. Bootstrap gives pre-designed components but less flexibility.

Q3: How React re-renders on Redux updates?

A: React listens to Redux store via useSelector. When state changes, components subscribed to it re-render.

Q4: Redux Middleware?

A: Middleware like redux-thunk or redux-saga intercept actions before they reach reducers. Useful for async logic.

Behavioral Questions

Q1: Bug you solved?

Flavouro Project - Full Code Explanation

A: Once, my Cart page wouldnt update. I learned I was mutating state directly. I fixed it using proper immutability via Redux Toolkit.

Q2: Staying updated?

A: I follow Dev.to, use GitHub explore, and build side projects using new tools like Vite and Zustand.

Q3: Team project role?

A: At CDAC, I handled the frontend implementation. I coordinated with backend developers and designed UI for child learning tools.

AI Feedback Handling Tips

Section 2: How to Handle AI Interview Feedback Prompts

1. "Too many filler words":
Pause instead of saying "uhh" or "like".
2. "Lacked depth":
Always explain Why + How.
3. "Low confidence detected":
Practice in front of a mirror. Use short, clear statements.
4. "No technical detail":
Mention tools by name: React Router, Redux, Tailwind.
5. "Too short":
Use the STAR format (Situation Task Action Result).

1-Week Interview Prep Schedule

Section 3: 1-Week SDE Interview Prep Plan

Day 1 Tell Me About Yourself + Project
Practice self-intro and Flavouro walkthrough
Record and review your speech

Day 2 React + Redux Deep Dive
Hooks, lifecycle, Redux slices
Solve 2 LeetCode problems

Day 3 Tailwind, UI, Routing
Build components in Tailwind
Explain ProtectedRoute.jsx

Day 4 Coding + DSA
Solve 2 easy + 1 medium DSA problems

Day 5 System Design (Lite)
Explain Flavouro architecture

Flavouro Project - Full Code Explanation

State management and scalability

Day 6 Full Mock Interview Day

1 Pramp or peer mock + 1 AI-based mock

Day 7 Final Review + Resume Polish

Reflect, refine, update GitHub & resume
