

Flavouro Project - Full Code Explanation

1. Can you walk me through your Flavouro project?

Flavouro is a responsive food ordering web app built with React, Redux Toolkit, and Tailwind CSS. Users can browse categorized food items, add them to a cart, and simulate a checkout. It uses protected routes, toasts for feedback, and a clean component-based architecture.

2. What problems does this app solve?

It demonstrates how to build a modern UI for e-commerce workflows: category filtering, cart logic, protected pages, and responsive design.

3. How is your app structured in terms of components?

The UI is split into reusable components like Navbar, FoodCard, Cart, etc. Pages like Home and Success are routed using react-router-dom. Redux slices manage the application's global state.

4. What's the purpose of ProtectedRoute?

It prevents direct access to the /success page unless the user has items in the cart. If the cart is empty, it redirects to home.

5. Why did you use Redux Toolkit instead of React Context or plain Redux?

Redux Toolkit simplifies setup and reduces boilerplate through createSlice and configureStore. It's more scalable for complex global state like cart and category filters.

6. Can you explain a Redux slice from your app?

The cart slice manages state like items and total. Reducers like addItem, removeItem, and clearCart handle cart operations using Immer for immutability.

7. How is navigation handled in the app?

Using react-router-dom. The app defines routes for home, success, and error pages. Navigation is handled via Link and Route components.

8. Why did you use Tailwind CSS?

Tailwind CSS allows rapid UI development with utility classes. It ensures responsive and consistent styling without writing custom CSS files.

9. How did you handle loading states or feedback?

I used react-spinners for loaders and react-hot-toast to show messages like 'Item added to cart' or 'Order placed successfully'.

10. What challenges did you face and how did you solve them?

Implementing protected routes was tricky. I solved it using a Redux selector to check if the cart had items, and redirected unauthorized users from the success page.

Flavouro Project - Full Code Explanation

11. What would you add if you had more time?

Login/authentication, persistent cart with localStorage or backend, real payment integration using Stripe, and an admin dashboard for managing items.
